

13. Background Images and Encoder Colors

Background Images

You can load background images to each page of the MPH. You can drag and drop an image, jpg or png format to the current page you are working on, from your file explorer. The image must be of 1920 x 1080 px resolution, jpg or png. The image will be saved when saving a preset and be placed in the Images folder on the same folder level as the Presets folder, in the MP/Host folder on your computer.

Encoder Background Colors

Right clicking on the inner area of each encoder will display a palette of colors which you can select to color code the encoders. It's a good practise to color encoders that belong in the same group, like an ADSR envelope. These encoder assigned colors are saved in multi host and single host presets.
