16. How to Reset the MP Host Plugin

All the settings and scanned plugins references are stored in the host.properties text file located in:

> Windows: C:\Users\USER\AppData\Roaming\MP\Host

> Mac: /Users/USER/Library/Application Support/MP/Host

To navigate to the host.properties file via the MP Host plugin see here

To reset all the settings and return to default delete or rename this host.properties file.

To reset the default preset, just delete the default.xml and it will be recreated the next time you load the MPH in the DAW.

When you delete the host.properties file your MPH presets will not be affected. When the host.properties file is deleted, you will need to select the target monitor the first time you run the MP Host plugin.

If when loading the MPH is loading a preset you created instead of the empty preset, delete the default.xml from the Presets folder.
