39. Using the Multi host plugin in Bitwig

Bitwig uses a sandbox process to host plugins. If you remove the **last** MP Multi host plugin and try to load another one, Bitwig will not be able to load it.

One option to address this problem is to always keep **one** Multi host plugin loaded.

The other option is, if you have removed the last one Multi host plugin, just double click on the MPHCSM.exe (Windows in the ~/MP/Host folder) or MPH Cache.app (Mac in Applications) to clear the cache and load the Multi host plugin.

> Important: In Bitwig setting > plugins > Plugin hosting mode
> set it to: Bitwig or Together or Vendor
