

46. The MP Bridge Utility

The MP Bridge utility is installed automatically with MP Host versions released after December 10, 2025.

MP Bridge handles switching between MP Controller software applications, meaning it controls what is shown on the controller display. It also switches the controller's MIDI device connection to the software currently in use.

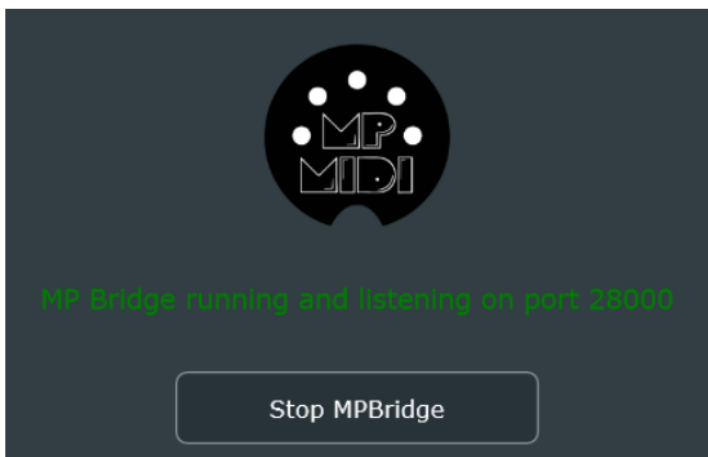

This applies when switching between MP Host effects and instruments.

For this reason, MP Bridge must be running at all times when using the MP Controller.

Once installed, MP Bridge starts automatically and is also configured to launch when the computer starts.

You do not need to run it manually.

The installer also adds a desktop shortcut for the MP Bridge Panel, which allows you to start or stop the utility when needed.

Locations:

Windows: C:\Program Files\MPBridge\

Mac: /Applications/MP Bridge/

If the MP Bridge is not running then the controller windows will not open.
